Imposter Websites

IMPOSTER WEBSITES You can follow the solid advice of someone more experienced, but you're still a prey if you accidentally visit a fake website. There are an astonishing number of websites designed to resemble startups that were originally running. If there is no little lock icon next to the address bar to indicate security, and there is no "HTTPS" in the site address, think again.

You may be redirected to a different payment platform, even if it looks identical to the site you are visiting. For example, you clicked on a link that looked like a legitimate site, but the attacker created a fake URL using null instead of the letter "o". This platform will definitely not lead you into the cryptocurrency investments you have already explored. To avoid this, carefully type the exact URL into your browser's address bar. Check this out too.
